We know what you need.

Drain, Clean, & Re-Fill Your Spa

For the cleanest, clearest water, change it every 3-4 months.

When using the Vision Sanitizing Cartridge, your water will last up to 6 months. The pictures in this instruction are from a 1998 Californian. Your spa may look a little different, but the steps are the same.

1. Turn off all power at the GFCI

2. Remove the 2 relief plugs near the filters. This will help prevent an airlock when you fill the spa. Be sure the o-rings on these plugs are in good condition.

3. Use a submersible pump to drain the water if you have one, otherwise...

4. Put a garden hose in the spa and turn it on as if you were filling the hot tub. Let it run about 10 seconds, then turn off the water.

5. Disconnect the other end of the hose at the bib. You can drain the water in your garden if all the chlorine has dispersed.

6. Take that end of the hose, and holding it low to the ground, move it where you want the water to drain. The siphon has been established, so the draining will begin immediately. Use as many hoses as you can to speed the process along.

7. Remove and rinse the filters thoroughly. Leave them out of the spa for now. Remove any debris from the bottom of the canister.

8. While waiting for the spa to drain, this is a good time to perform some preventative maintenance. Rinse the filters, clean the Jets and Selector Valve Assembly. See the "How To" Section of our Website for more details.

9. When it's empty, wash the UltraLife shell with baking soda or Soft Scrub. A wet rag or either side of a Scotch Brite pad works fine. Smooth acrylic shells should be cleaned with a spa surface cleaner and wet rag or sponge.

10. As you are cleaning, open as many jets as possible by turning the outside ring to the right. This will help prevent an air lock when you are filling the spa later.

11. Using a Wet/Dry Vac if you have one, vacuum as much water as possible. Starting in the filter canister(s), moving to the seats, and finally the floor. If you don't have a suitable Wet/Dry Vac, you'll be using a plastic container and rag to do this work. Remove the balance of the sand and water on the floor with a rag.

12. Start filling the spa 1/2 way by putting the running hose in the filter compartment that usually has the cap over it. Fill the spa the rest of the way through the filter compartment that usually has the filter basket in it.

13. The water line should be in the middle of the tile. Re-install the filters.

14. Turn the power back on at the GFCI

15. Test the jets buttons to be sure both pumps, (and the circulation pump if you have one), are operating properly and water is flowing through the jets.
16. When everything is operating properly, re-install the 2 relief plugs.

17. Add your new Vision cartridge
18. Balance the water according to the procedure on our guide. Shock and add sanitizer as needed.
19. Add Ducky and relax.
